What is it Like to Be a Robco Customer

Going solar is a big decision, and it’s natural to wonder what the process feels like once you sign up. At Robco Electric, we’ve built our solar service around one idea: make it simple, transparent, and genuinely tailored to your home. Here’s what that looks like to be a Robco Customer in practice.

It Starts with a Free Home Energy Assessment

Before we recommend anything, we will come to you. Our team evaluates your roof’s orientation, shading patterns, and your household’s actual power usage. The Las Vegas sun is powerful, but every roof catches it differently, and every family uses electricity differently. We’re not interested in selling a generic package; we’re interested in understanding your home.

Your System Is Designed Around You

Once we know how your home uses energy, we design a system to match, not oversized, not undersized. We work with trusted equipment brands like Enphase, known for reliable inverters and smart monitoring capabilities. The result is a setup engineered for your specific consumption, so you’re not paying for capacity you don’t need or living with a system that falls short.

We Handle the Paperwork, So You Don’t Have To

Solar installation involves more red tape than most homeowners expect: permits, utility interconnection approvals, and HOA applications. This is where a lot of customers feel overwhelmed if they’re going alone. Our team manages the entire administrative process on your behalf, so you can stay focused on the excitement of going solar instead of getting buried in forms.

Installation Is Fast and Professional

Once permits clear, most Robco installations move quickly, often just a matter of days. Our technicians handle everything with an eye for both performance and appearance, because a solar system should work hard and still look clean on your roofline.

Real-Time Monitoring Puts You in Control

After activation, you're not left in the dark about how your system performs. Through app-based monitoring, you can track your energy production and savings in real time. Noticing a dip in output? You'll see it early, often before it becomes a real problem, which means faster fixes and consistent savings.

One Team for Solar and EV Charging

Many of our solar customers are also interested in EV charging, and we make that pairing seamless. Whether you need a Level 1 or Level 2 home charger, our team can integrate it directly with your solar setup, all under one relationship, no juggling multiple contractors or worrying about compatibility.

Local Support That Doesn't Disappear After Install

Perhaps the biggest difference customers notice when they need help, they're not stuck in a national call center queue. Robco Electric is based right here in Las Vegas. Service calls, questions, and repairs are handled by a local team that knows the systems we installed and knows the desert conditions those systems operate in.

The Bottom Line

Being a Robco Electric Solar customer means having a partner from the first assessment through years of ongoing power production, not just a company that shows up once to install panels and disappears. It's solar done with the kind of attention and follow-through that turns a one-time purchase into long-term peace of mind.
